Airflow Model TA465 Plug-In Probes

The plug-in probes allow users to make various measurements by simply plugging in a different probe that has the features and functions best suited for a particular application.

Plug-in probes for the TA465 series can be ordered at any time and include a data sheet with certificate of traceability. When it's time for servicing, only the probe needs to be returned since all the calibration data is stored within the probe.

Thermoanemometer Air Velocity Probes

Airflow Instruments offers four models featuring multiple measurements in a compact, robust probe design. These telescopic probes are available in straight or articulating construction, and with or without a relative humidity sensor. Models with a relative humidity sensor can also calculate wet bulb and dewpoint temperature.

Common applications include duct traversing, face velocity testing of chemical fume hoods, biological safety cabinets and HEPA filters. When combined with the TA465, advanced measurement applications can be performed including heat flow, draft rate and turbulence intensity.

Rotating Vane Anemometer Probes

The 100 mm (4 in.) rotating vane probe measures air velocity and temperature with flow calculation. Measurement applications include face velocity as well as air velocity in turbulent airstreams. An optional telescopic articulating probe and an Aircone kit are also available.

Pitot Probes and Airflow Probe 800187

Pitot probes are used to obtain air velocity and air volume measurements within ductwork by performing a duct traverse. Consult factory for sizes and part numbers.

The Airflow Probe Model 800187 is an 46 cm (18 in.) straight Pitot probe that can be used to perform duct traverses and are ideally suited for measuring in small diameter ductwork.

LogDat2™ Downloading Software

The Airflow Model TA465 Series includes downloading software called LogDat2. LogDat2 software transfers the stored data from the Model TA465

to a computer as a spreadsheet file. This software is useful for applications such as duct traverses, fume hood, and filter face velocity testing.

¹ Pressure velocity measurements are not recommended below 5 m/s (1,000 ft/min) and are best suited to velocities over 10.00 m/s (2,000 ft/min). Range can vary depending on barometric pressure.

² Accuracy is a function of converting pressure to velocity. Conversion accuracy improves when actual pressure values increase.

³ Overpressure range = 360 mmHg, 48 kPa (190 in. H₂O).

⁴ Temperature compensated over an air temperature range of 5 to 65°C (40 to 150°F).

⁵ The accuracy statement begins at 0.15 m/s through 50 m/s (30 ft/min through 9,999 ft/min).

⁶ Accuracy with instrument case at 25°C (77°F), add uncertainty of 0.03°C/°C (0.05°F/°F) for change in instrument temperature.

⁷ Accuracy with probe at 25°C (77°F). Add uncertainty of 0.2% RH/°C (0.1% RH/°F) for change in probe temperature. Includes 1% hysteresis.

⁸ At 25°C (77°F). Add uncertainty of 0.36%/°C ($\pm 0.2\%$ /°F) for change in temperature.

⁹ At calibration temperature. Add uncertainty of 0.5%/°C ($\pm 0.28\%$ /°F) for change in temperature.

¹⁰ When response factor is set to 1.00.
